

MedPass

The patient-owned medical identity platform for Uzbekistan

QR check-in • AI-explained diagnoses in Uzbek • Lifetime medical history

Business Plan & Investor Overview

The Problem

40 min

of repeated paperwork, on average, per hospital visit

That's time, money, and health outcomes lost before a patient even sees a doctor.

!

Repeated intake paperwork at every single hospital visit

!

Medical records fragmented across hospitals with no shared history

!

Patients leave consultations not understanding their own diagnosis

The Solution

Three pillars, one product — built AI-first in Uzbek medical language

QR Check-In

Patients scan a QR code at reception — no repeated intake forms.

AI-Explained Results

Diagnoses and results explained in plain Uzbek, right after the visit.

Lifetime Medical Vault

One record that travels with the patient across every hospital.

Executive Summary & Thesis

What MedPass Is

A patient-owned medical identity platform: QR check-in, AI-explained diagnoses and results in Uzbek, and a lifetime medical history that travels with the patient across hospitals.

Sharp Thesis

Patients — not institutions — should own their medical data.
Monetize by selling hospitals faster reception and better patient flow, while giving patients free access to understand their own health.

Category Framing

Not a hospital EMR. Not a telemedicine app. MedPass is a “patient intelligence layer” that sits on top of existing hospital and government systems.

How It Works

The demo: 40 minutes of paperwork, replaced by a 45-second scan

40 min

today, on paper

45 sec

with MedPass

1

Patient scans QR at reception

2

AI organizes full history instantly

3

Doctor consults with complete context

4

Patient gets AI-explained results in Uzbek

5

Visit is stored in the lifetime vault

Market Opportunity

Market Structure

~9,000

private clinics in Uzbekistan

DMED

government public EMR — covers primary care

X Med / AskDoctor

small, fragmented booking-app segment

No unified private-sector patient layer exists yet.

TAM

~70M

people across Central Asia

SAM

~9,000 clinics

Uzbekistan private healthcare, growing urban patient base

SOM

A handful of clinics

Tashkent private clinics & their patients, year one

Customer Segments & Ideal Customer

Who Pays, Who Uses

B2B

Private Hospitals & Clinics

The paying subscriber — buys faster reception and better patient flow.

B2C

Individual Patients

The freemium user — gets free access to understand their own health.

B2B2C

Specialist Clinics, Pharma & Insurers

Future layer, once the core network is established.

Ideal Customer Profile

- ✓ Mid-to-large private clinics
- ✓ High daily patient volume
- ✓ Existing digital-reception intent
- ✓ Administrators frustrated by paperwork bottlenecks and staff time loss

Jobs to Be Done

Jobs to Be Done

Hospitals hire MedPass to...

Cut reception time and reduce staff paperwork load.

Patients hire MedPass to...

Understand their own health and avoid re-explaining their history at every visit.

Business Model & Monetization

Four revenue streams — hospital subscription is primary at MVP stage

Pricing Strategy

Hospitals

\$200–400/month flat subscription

Patients

Free: 3 AI explanations/month • Premium: \$2.99/month (unlimited AI, vault, medication intelligence)

Deck Note

At MVP stage, keep the revenue slide focused on the hospital-subscription stream — it's the clearest, most fundable story.

Unit Economics & Cost Structure

Unit Economics

Hospital-side

Low CAC — relationship-driven sales via the Ministry network — against \$200–400 MRR per hospital.

Patient-side

Depends on free-to-paid conversion — unproven pre-launch.

Customer ROI Framework

Staff time saved (min/patient × daily volume) converted to monetary value, compared against subscription cost — should show a clear, fast payback.

Cost Structure

- AI / LLM inference
- Engineering — 3 cofounders + eventual hires
- Hospital onboarding & support
- Compliance & legal (data protection)
- Cloud infrastructure with local data residency

Competitive Landscape

Player	What They Do	Threat Level
DMED (Ministry)	Booking, results, e-prescription — already live	HIGH
X Med / AskDoctor	Booking only	LOW
AKFA Medline	Hospital-run portal, single institution	MEDIUM
Pharmacy apps	Complementary, not competing	—

Competitive Differentiation

MedPass combines QR reception + AI explanation + a cross-hospital lifetime record in one product — built AI-first in Uzbek medical language, rather than translated afterward.

Defensibility

STRONGEST

Proprietary Uzbek Medical AI Terminology Layer

Built AI-first for Uzbek medical language — not a translation layer bolted onto an existing product. This is the asset that compounds over time.

Adoption Barriers

Patient Trust

Sharing health data with a private app is a real ask — trust has to be earned.

Doctor Time

Reviewing AI-generated summaries adds a step to an already tight schedule.

Hospital Behavior

Reception staff need to change habits, not just software.

DMED's Rollout

The mandatory government rollout is absorbing clinic attention and resources right now.

Legal, Regulatory & Business Risks

Legal & Reputational

Health data is sensitive personal data under Uzbekistan's data protection law, including data-localization requirements. The “low regulatory risk” framing needs real legal review — not just positioning.

Business Model Risks

- ! DMED extending into the same patient-AI space
- ! Low patient premium conversion
- ! Doctor-approval step causing workflow friction
- ! A data-privacy incident early on being disproportionately damaging

Go-to-Market & Roadmap

Investor Attractiveness

Strengths

- ✓ Clear B2B revenue from day one
- ✓ Large regional TAM
- ✓ Strong, non-overlapping founding team

Watch-Outs

- ! Weak moat claims, as currently framed
- ! Unproven unit economics at this stage

Fundraising Narrative

“We're the AI-native private-sector layer built specifically for Uzbek medical language, riding on top of a market undergoing forced digitalization.”

Narrower and more credible than “first mover in an empty market.”

The Strongest Narrative

MedPass is the fast-moving, AI-native private-sector complement to a slower-moving mandatory government rollout — proven first through hospital subscription revenue, with patient network effects and the Uzbek AI language asset as the long-term moat.
